**Why Wood?** The “materials debate” has compelling arguments for and against the merits of wood materials. Our goal is to debunk the myths and highlight the merits of owning a wooden made pleasure craft. In truth, it really doesn't matter. Your decision is a personal expression of who you are and how you choose to spend your leisure time.

*There is a feeling that wood conveys which other materials simply cannot.*

The natural benefits of wood combined with modern day materials offers the best of both worlds. There is nothing that quite compares to **the beauty of natural wood on water**. Wood provides tremendous flexibility which results in hulls that are significantly lighter and stronger. This means considerably **greater fuel efficiency** and less of a carbon footprint.

There is a common misconception that wooden boat maintenance is far more time consuming. This is no longer true. While re-painting, soaking and rot once presented an issue, materials such as fibreglass coatings and epoxy resins have long since ended that worry. These boats will last an incredibly long time with no added maintenance beyond fiberglass boats.

## CRUISING

Muskoka in Motion offers plush and roomy seating for 8 passengers. We understand that comfort is a priority. This is why we have created a rib & tuck design with wrap around seating options to enhance your boating experience. Only the finest marine grade upholstery materials are used to enjoy many years of use without excessive wear.

The dashboard, finished in mahogany is simple, yet elegant and functional, the way we believe it should be. Seating is offered in several attractive layout designs and the colour of your choice depending on your personal needs.

We understand that your time is important and so are your guests. Feel at ease either quietly cruising the waters or turn on the Sony marine stereo system, standard with every boat.

## THE HULL

Canadian cedar is used for all planking and red oak for the keel, ribs & stringers. The design of this wooden hull means a higher strength to weight ratio when compared to a fiberglass boat. This means you have a stronger boat with less weight. Fibreglass boats need to be 2-3 times heavier to achieve the same strength.

## THE DECK

The front and rear decks all come with standard high quality Mahogany to offer a prestigious, beautiful finish. Various custom decking arrangements and combing options are available.

## THE FINISH

Four layers of spar varnish are applied to the exterior including all decks. The natural beauty of the wood remains visible from the sprayrails to the gunwhales. This tough, durable exterior guarantees a watertight weather resistant finish that is near maintenance free.
